

# MGDUFF

MGDUFF is the UK's original marine cathodic protection company.

In the early 1950's Merlin Graham "Chunky" Duff, partnered by naval architects and marine engineers, developed and set the standards for ship and small craft corrosion protection. Sixty years on these are still the accepted principles and our continuous development builds on that heritage, keeping pace with modern vessel design and construction.

Sacrificial anodes in zinc, aluminium and magnesium are manufactured at our foundries here in the UK, in accordance with internationally approved specifications and using the highest purity ingredients.

MGDUFF products are specified and fitted by leading European yacht and boat builders, commercial shipping companies and ship repair yards. Experienced personnel offer customers cathodic protection schemes, full technical back-up and produce anode designs for ships, tugs, ferries, and superyachts.

## FOUNDRY

MGDUFF's main foundry and warehouse, located at our south coast head office in Chichester, has the flexibility to meet short lead time requirements on bespoke anodes whilst maintaining excellent stock levels on standard items. All anodes are manufactured to strict quality standards through an ISO 9001 Quality Management System, and in particular our zinc anodes meet the stringent US Mil-A-18001K specification code.

Each melt is batch tested using our in-house spectrometer to check chemical composition. This ensures the correct percentage of alloying materials has been added, producing only a top quality anode.

## CORROSION WILL OCCUR IN ALL TYPES OF WATER WITH DRAMATIC EFFECT

Metals of differing electrochemical potential when in contact with one another form Galvanic cells. The metal with a lower potential in the galvanic cell will be anodic and will corrode. The same effect can occur in areas of different electrochemical potential in a single piece of metal such as a steel plate. Any craft moored and operating in fresh, salt or estuarine water is at risk from corrosion and the effects can be costly.

Corrosion on Steel & Aluminium vessels can be identified as either areas of localised pitting to the hull plate, rudders, bilge keels etc. or less obviously in the form of general wastage of the hull plating often occurring below the paint coating. Pitting can lead to the complete penetration of the hull below the waterline. General wastage of the steel can be just as critical, weakening the hull and necessitating expensive re-plating.

Corrosion on Aluminium vessels is also generally in the form of localised pitting to the hull plate, rudders, bilge keels and particularly in way of weld seams. Pitting can lead to the complete penetration of the hull below the waterline necessitating expensive re-plating.

On Wood and GRP vessels the areas of concern are principally the stern gear i.e. The propellers, shafts, shaft brackets, stern tubes and rudders which are expensive to replace and vital to the vessel, the failure of a propeller or rudder could have disastrous consequences. The effects of corrosion can vary from pitting of propellers and shafts to the decomposition of the alloy of propeller. The failure of something as small and inexpensive as a split pin can result in the loss of the propeller.

Stray current leakage is quite often cited as the cause of corrosion on all types of vessel however more often than not the problem can be traced to a galvanic action. Stray current leakage is the action of electrical current from an external power source such as a battery or shore power supply which because of some electrical system fault on board the vessel passes out through the hull or a fitting in the hull and flows through the water causing "Electrolytic" corrosion. Stray current leakage is usually a result of damage or wear to the wiring system or poor installation of wiring or electrical equipment.

## WHAT CAN BE DONE TO PREVENT CORROSION?

The selection of materials is of prime importance in the construction of craft. Generally naval architects and boat builders ensure that they select metals which are as far as possible compatible to each other and when this is not possible metals must be isolated from one another. There will always be occasions when fittings or steel-work require replacement or repair and it is important that when this is done attention is paid to the same criteria. In particular ensure that fastenings and split pins are compatible and of the highest quality. The paint system on any boat is an important first barrier against corrosion. Seek advice from the paint manufacturers for their recommendations on the most appropriate coating system and follow the application instructions completely. Ensure that a good anti-corrosive primer is applied if anti fouling is to be used. When using a copper based anti-fouling none of the paint must be applied directly to bare metal surfaces.

Vegetable oil based paints, although far less widely available than in the past, should not be used with cathodic protection systems as the paint tends to saponify.

The correct installation of electrics on a boat will reduce the possibility of stray current leakage and the following actions are recommended:

- Use only high grade insulated wiring of suitable capacity. Undersized wires will cause resistance and consequent voltage drop.
- Clip or support all wires at suitable intervals to prevent fatigue and eventual fracture.
- Use only corrosion resistant terminals and connectors and make sure that all are clean and tight.
- Attach only the main battery leads to battery terminals.
- Fit an isolation switch in the battery circuit.
- Ensure that all battery circuits are correctly fused.
- Keep all wiring, connections and junction boxes above the bilge area and other areas likely to become wet.
- Make sure that when fitting additional equipment the work is carried out in accordance with the manufacturer's instructions. The polarity of connections should be correct and each circuit must be correctly fused.
- Electrical and Electronic work is best carried out by a qualified marine electrician.

- Ongoing maintenance on your boat is essential. Metal work, paint coatings and electrical installations all require regular inspection. In particular you should inspect the wind and water line area if owning a steel vessel. This area is particularly vulnerable because it is often prone to mechanical damage but derives no protection from an anode system being above the water line.

## WHAT IS CATHODIC PROTECTION?

Cathodic protection is an electrochemical process which halts the natural reaction (corrosion) of metals in a particular environment by superimposing an electrochemical cell more powerful than the corrosion cell. Sacrificial Anodes are fitted or bonded to the metal to be protected which in turn as it has a greater electrical potential than the anode material becomes cathodic and causes the anode to waste instead of itself. In a correctly installed MGDUFF Cathodic Protection

System the only corrosion occurs to the sacrificial anode which is replaceable. The number and size of anodes is determined by the type of material and the surface area being protected.

The term bonding refers to the connection of the anode to a remote metal component such as the propeller shaft or rudder stock and it should be remembered that the integrity of the bonding is critical to the effectiveness of the cathodic protection system.

Several factors determine the type of cathodic protection system fitted. Firstly the environment in which the vessel is operating, secondly the size and type of construction and finally the length of time that the vessel is likely to be afloat before the next maintenance slipping.

## FIT THE CORRECT ANODE MATERIAL FOR THE WATERS YOUR VESSEL IS OPERATING IN

As a general rule owners should fit the anodes suitable for the environment they most regularly berth in and the following table provides a useful guide:

Salt Water	Fit	Zinc or Aluminium Anodes
In Brackish Water	Fit	Aluminium Anodes
In Fresh Water	Fit	Magnesium Anodes

Some vessels will from time to time move between salt and fresh water, others are berthed within marinas and behind tidal barriers where the water is enclosed and likely to be brackish or even virtually fresh. Owners must be aware of the effects that this may have on their boats and fit the correct cathodic protection system to avoid corrosion.

Not all anodes are suitable for every environment, for example the surface of a zinc or aluminium anode will if left in fresh water for some time become covered with an off white crust of oxide which effectively seals the anode and stops it working even when returned to salt water. Zinc Anodes suffer a similar problem even in brackish conditions whereas Aluminium will continue to operate effectively in river estuaries and other areas of brackish water indefinitely. The consequences of this passivation of the anode are that the next most anodic item within the anode bonding system will start to sacrifice itself which could of course be very serious.

It is therefore very important to check Zinc and Aluminium anodes after any trips into fresh water and if necessary clean off or change the anodes.

Should a vessel move into fresh water for more than two weeks MGDUFF recommend that an alternative anode system is used suitable for fresh water situations.

Magnesium Anodes on the other hand have a much higher driving voltage than zinc or aluminium making them highly suitable for use in Fresh Water, they will however become very active in salt water where they will probably only last a matter of months. Protected surfaces can build up a layer of off white calcarious deposit which will be difficult to remove.

Magnesium anodes are not designed for prolonged use in sea water and if you are taking your boat into a salt water location for more than seven days (Fourteen days in any one year) you should consider changing the anodes.

**Magnesium Anodes should never be fitted to wooden hulled vessels as they can damage the timber.**

## CATHODIC PROTECTION OF WOODEN AND GRP HULLED VESSELS

To determine the number and size of anodes required, match the type of vessel and select the anode suitable for the size of propeller and the type of water

■ **TYPE A** Vessels are single screwed with a very short length of propeller shaft exposed to the water and fitted with GRP or wooden rudders. One anode will be required to protect the propeller and shaft

■ **TYPE B** Vessels are single or twin screwed with a long length of propeller shaft exposed to the water supported by a shaft bracket. One anode will be required to protect each shaft assembly. Bronze or stainless steel rudders or GRP rudders with bronze or stainless steel stocks should also be bonded to the same anode, however mild steel rudders will require separate anodes.

■ **TYPE C** Vessels are single screwed with a long length of propeller shaft exposed to the water supported by a shaft bracket and GRP rudders with bronze or stainless steel stocks. One anode will be required to protect the propeller, shaft and rudders.

### For Type A, B or C Vessels the following anode selection table applies

FOR EACH PROPELLER ASSEMBLY FIT ONE

Propeller Diameter	In Salt Water	In Salt or Brackish Water	In Fresh Water
250mm	ZD56 Zinc Anode	AD56 Aluminium Anode	MD56 Magnesium Anode
500mm	ZD77 Zinc Anode	AD77 Aluminium Anode	MD77 Magnesium Anode
750mm	ZD78B Zinc Anode	AD78B Aluminium Anode	MD78B Magnesium Anode

**All schemes must be inspected annually and the anodes renewed if more than 50% wasted**

■ **TYPE D** Vessels are those fitted with saildrives, sterndrives or outboard motors. Most are fitted with sacrificial anodes specifically designed for them, and MGDuff replacements may be found on pages 22-29. We recommend regular visual inspection of outboards and sterndrives when moored, at least every 2-3 months, as the wear rate of the anodes can be affected by a variety of factors:

- The degree of tilt of the drive – anodes must be fully immersed.
- Substitution of aluminium propellers by stainless steel versions.
- Addition of stainless steel accessories such as propeller guards
- Loss of electrical continuity – many sterndrives have small continuity wires fitted between the component parts which must be replaced if broken, and stainless steel clips on rubber gaiters can loosen through pitting corrosion.

Saildrive anodes too can be affected by bronze propellers and stainless steel rope cutters.

In these circumstances we recommend that a supplementary anode is fitted to the hull and bonded to the transom plate or drive flanges as shown:

#### SELECT APPROPRIATE ANODE:

Propeller Diameter	In Salt Water	In Salt or Brackish Water	In Fresh Water
250mm	ZD56 Zinc Anode	AD56 Aluminium Anode	MD56 Magnesium Anode

**All schemes must be inspected annually and the anodes renewed if more than 50% wasted**

#### CATHODIC PROTECTION OF WOODEN HULLED VESSELS

Wooden hulled vessels operating in fresh water are subject to the same corrosion problems as GRP craft. However the fitting of magnesium anodes is **NOT** recommended as they will have a damaging effect on the timbers around the fixings known as electro-chemical decay.

MGDUFF advise that the appropriate action is to fit a magnesium shaft collar on the exposed propeller shaft and if necessary to fit anodes directly to mild steel rudders and keels.

**MAGNESIUM ANODES SHOULD NEVER BE FITTED TO THE  
TIMBERS OF A WOODEN HULLED VESSEL**

## FITTING AND BONDING SACRIFICIAL ANODES

### WHEN FITTING ANODES TO WOODEN OR GRP HULLED VESSELS REMEMBER:

- The anode should be positioned on the outside of the hull below the waterline.
- The anodes can “see” the parts to be protected.
- The fixing studs are located above the bilges.
- The anode location ensures the minimum run of bonding cable to the parts to be protected.
- There must be reasonable internal access to the studs.
- The anode should not be positioned forward of or in line with Echo Sounding Transducers or log Impellers.

#### Hull Anode Installation

- Stiffen the inside of the hull where the anode is to be fitted if necessary.
- Drill holes to take the fixing studs at the appropriate centres.
- On wooden hulled vessels studs should be sleeved or painted to insulate them from the surrounding timber. When sleeving the stud either use a heat shrink tube or ensure that the inside of the sleeve is packed with marine grade sealant.
- Before inserting and securing each stud assembly, apply a generous amount of marine grade sealant to the shank and collar where the stud touches the hull to ensure a good seal.

- Whenever an anode is fitted to a GRP or wooden hull an anode backing sheet must be used to control the wastage of the anode and protect the hull. The anode backing sheet should be replaced each time the anode is replaced.
- Always ensure that the anodes are fitted with MGDUFF Fan Disc Washers under the securing nuts which will help to assure the contact between anode and cathodic protection system. The fan disc washers and nuts should be replaced each time the anode is replaced.
- Protect the anode fixing studs on assembly with paint or grease inside and outside the vessel.

### CATHODIC PROTECTION OF ALUMINIUM HULLED VESSELS

Aluminium is an excellent material for boat construction, but needs special attention regarding cathodic protection and paint application. For anode selection and placement refer to the technical sheets on the MGDuff website.

**WHEN USING A COPPER BASED ANTIFOULING ENSURE NO PAINT IS APPLIED DIRECTLY TO BARE METAL SURFACES**

### BONDING THE CATHODIC PROTECTION SYSTEM

- The correct bonding of the cathodic protection system is imperative.
- Use 4mm<sup>2</sup> PVC Insulated Multi-Stranded Copper Cable or larger.
- Ensure that all connections are clean and tight.
- The best way to bond the anode to the shaft is by using a MGDUFF Electro Eliminator as well as bonding the anode to the gear box or Engine casing.
- Insulated Flexible Couplings should be bridged by using a short length of bonding cable or a copper strap to carry through the contact between anode shaft and propeller.
- Bronze and Stainless Steel Rudders, Rudder Hangings and Shaft Brackets should also be bonded to the main anodes.
- Trim Tabs should be protected with separate anodes.
- Do not bond the same anode to ferrous and non-ferrous metals. Steel Rudders must be protected with separate anodes.

# CATHODIC PROTECTION OF STEEL HULLED VESSELS

WHEN DETERMINING THE CATHODIC PROTECTION REQUIREMENTS FOR A STEEL HULLED VESSEL THE FIRST CRITERION IS THE SURFACE AREA OF STEEL HULL BELOW THE WATER LINE - THE WETTED SURFACE AREA.

This is calculated by multiplying the water line length by the sum of the beam and draft i.e.  $LWL \times (Beam + Draft)$ . This calculation will apply to most motor cruisers and sailing boats.

Once the wetted surface area is calculated, it can be applied to the selection tables below from which the number of anodes required can be taken.

## For One Year in Salt Water fit the following Zinc Anodes

Area		Hull	Anodes per Rudder
Up to 28m <sup>2</sup> (300ft <sup>2</sup> )	Stud Fixed	2 x ZD78B	2 x ZD56
	Welded	(2 x ZD78)	(2 x ZD76)
28.1 - 56m <sup>2</sup> (300ft <sup>2</sup> )	Stud Fixed	4 x ZD78B	2 x ZD56
	Welded	(4 x ZD78)	(2 x ZD76)
56.1 - 84m <sup>2</sup> (600 - 900ft <sup>2</sup> )	Stud Fixed	6 x ZD78B	2 x ZD56
	Welded	(6 x ZD78)	(2 x ZD76)
84.1 - 102m <sup>2</sup> (900 - 1100ft <sup>2</sup> )	Stud Fixed	4 x ZD72BM	2 x ZD58
	Welded	(4 x ZD80)	(2 x ZD77)
102 - 148m <sup>2</sup> (1100 - 1600ft <sup>2</sup> )	Stud Fixed	6 x ZD72BM	2 x ZD58
	Welded	(6 x ZD80)	(2 x ZD77)

## For Two Years in Salt Water fit the following Zinc Anodes

Area		Hull	Anodes per Rudder
Up to 28m <sup>2</sup> (300ft <sup>2</sup> )	Stud Fixed	4 x ZD78B	2 x ZD58
	Welded	(4 x ZD78)	(2 x ZD77)
28.1 - 56m <sup>2</sup> (300ft <sup>2</sup> )	Stud Fixed	8 x ZD78B	2 x ZD58
	Welded	(8 x ZD78)	(2 x ZD77)
56.1 - 84m <sup>2</sup> (600 - 900ft <sup>2</sup> )	Stud Fixed	4 x ZD72B	2 x ZD58
	Welded	(6 x ZD73)	(2 x ZD77)
84.1 - 102m <sup>2</sup> (900 - 1100ft <sup>2</sup> )	Stud Fixed	6 x ZD72B	2 x ZD78B
	Welded	(6 x ZD73)	(2 x ZD78)
102 - 148m <sup>2</sup> (1100 - 1600ft <sup>2</sup> )	Stud Fixed	8 x ZD72B	2 x ZD78B
	Welded	(8 x ZD73)	(2 x ZD78)

## For One Year in Salt or Brackish Water fit the following Aluminium Anodes

Area		Hull	Anodes per Rudder
Up to 28m <sup>2</sup> (300ft <sup>2</sup> )	Stud Fixed	2 x AD78B	2 x AD56
	Welded	(2 x AD78)	(2 x AD76)
28.1 - 56m <sup>2</sup> (300ft <sup>2</sup> )	Stud Fixed	4 x AD78B	2 x AD56
	Welded	(4 x AD78)	(2 x AD76)
56.1 - 84m <sup>2</sup> (600 - 900ft <sup>2</sup> )	Stud Fixed	6 x AD78B	2 x AD56
	Welded	(6 x AD78)	(2 x AD76)

## For Two Years in Salt or Brackish Water fit the following Aluminium Anodes

Area		Hull	Anodes per Rudder
Up to 28m <sup>2</sup> (300ft <sup>2</sup> )	Stud Fixed	4 x AD78B	2 x AD58
	Welded	(4 x AD78)	(2 x AD77)
28.1 - 56m <sup>2</sup> (300ft <sup>2</sup> )	Stud Fixed	8 x AD78B	2 x AD58
	Welded	(4 x AD78)	(2 x AD77)
56.1 - 84m <sup>2</sup> (600 - 900ft <sup>2</sup> )	Stud Fixed	4 x AD72B	2 x AD58
	Welded	(4 x AD73)	(2 x AD77)

## For Two Years in Fresh Water fit the following Magnesium Anodes

Area		Hull	Anodes per Rudder
Up to 28m <sup>2</sup> (300ft <sup>2</sup> )		4 x MD78	2 x MD56
28.1 - 56m <sup>2</sup> (300ft <sup>2</sup> )		4 x MD73	2 x MD56
42.1 - 56m <sup>2</sup> (450 - 600ft <sup>2</sup> )		4 x MD72	2 x MD56
56.1 - 70m <sup>2</sup> (600 - 750ft <sup>2</sup> )		6 x MD72	2 x MD77

**NOTE** When fitting and replacing bolt-on anodes always ensure that the serrated fan disc washers are replaced

Four anode fixing plan - narrow boat

Six anode fixing plan - narrow boat

## HULL ANODES

### Bolt On Anodes

MGDUFF bolt on hull anodes have a variety of stud centres and hole diameters to suit all European and American designed boats. Bolt on anodes are a quick and effective way to secure anodes to your vessel, without the need for any specialist tools. MGDuff have a full range of fixing solutions to suit your vessel, please see page 18 & 19 for more information.

## Zinc Strip Anodes (ZD42)

This is a low profile zinc anode with a non reactive aluminium insert, ideally suited for fitting to high speed vessels.

Maximum length is 72" (1828mm), available cut to suit with a variety of different hole centres or via standard configurations detailed below.

SALT WATER	BRACKISH WATER	FRESH WATER

## HULL ANODES

### Weld On Anodes

Weld on anodes are recommended on vessels where a long life anode scheme is fitted or where the anodes may be subject to considerable abrasion, vibration or other physical disturbance. For guaranteed continuity and a 100% secure fixing, a welded connection is best. All MGDuff zinc anodes are supplied with a cast-in steel core bars. A guide for anode selection can be found on page 8 & 9 of the catalogue.

### Anode Fixing Studs

MGDUFF anode fixing studs (M10B & M16B range plus Stainless Steel) feature a fully welded square plate mounting washer, which is more secure than some designs with a simple threaded washer. Anode studs are a one time fitment and as a through hull fitting, the best available should be used. Often anodes are secured **incorrectly**, the anode core bar should be secured and **not** the anode material to the structure!

### Anode Backing Sheets

A backing pad is designed to stop the back of the anode from wasting away, and possibly causes the anode fixing to come loose. It also provides a barrier to help protect a GRP hulls from alkality that can be produced as part of the cathodic protection process.

## SHAFT ANODES

### MGD Shaft Anodes

The **MGD** range of shaft anodes are known for their superior quality, and particularly suited to vessels with high shaft speeds.

Building on the integral core bar design that controls wastage, ensuring the shaft anode remains secure, the MGD range now incorporates socket head (allen bolt) stainless steel fixings with captive nuts to ensure maximum reliability. Available in a wide range of metric and imperial sizes, offering a direct fit for your propeller shaft.

## SHAFT ANODES

### Shaft Collar Anodes

Shaft Collar Anodes are an ideal solution for boats with limited clearance between the propeller and propeller bracket. The ZSC and ZSC(T) range fits this bill, with its thin moulded section.

The ZSC(T) collar is one of the thinnest shaft anodes on the market, allowing boat owners with minimal shaft clearance to protect their valuable propeller and shaft.

### Shaft Earthing Assembly - Electro Eliminator

Whether your boat is steel or GRP, to provide the best protection to the stern gear the shaft should be fitted with an MGDUFF Electro Eliminator Brush assembly.

The MGDUFF Electro-Eliminators offer the most effective shaft bonding solution. Running directly onto the propeller shaft the electro eliminator puts the anode in constant low resistance contact with the propeller shaft.

The copper graphite brushes will give at least 2000 running hours under normal conditions. The electro eliminators will also remove the interference to electronic equipment caused by the rotating shaft.

**Top Tip** - Always use an Electro Eliminator in conjunction with the standard anode to engine bonding connection and not on its own!

➔ To provide the best protection for the stern gear, the shaft should be fitted with an electro-eliminator brush and connected to the hull anode.

**Electro Eliminator - EE1**  
shaft earthing assembly for propeller shafts up to 50mm diameter. Comes with mounting bracket.

**Electro Eliminators - EE2/208**  
Shaft earthing assembly for propeller shafts over 40mm dia to 100mm. Does not include mounting bar.

**Electro Eliminator - EE3**  
shaft earthing assembly for propeller shafts up to 200mm diameter.

\* All anode weights shown are nominal \*

## THRUSTER ANODES

### Sleipner Side Power Bow & Stern Thruster Anodes

Bow & Stern thrusters are more common than ever, helping you to control your craft in all situations. MGDUFF supply 5 sizes of anodes to suit the most popular Sleipner Side Power thrusters on the market. All of the anodes in the range offer a simple bolt on fixing directly to the thruster unit giving you maximum continuity.

## HANGING ANODE

### What Are Hanging Anodes?

Hanging anodes are an alternative method to hull mounted anodes and will provide the same cathodic protection for all types of water craft whether GRP, steel or wood. Most leisure craft are constructed of GRP and the following information is based on this type of vessel. Hanging anodes can also be used to protect sail drives, sterndrives and even outboards. The anode is hung over the side of the craft and the cable is connected inside the vessel to provide continuity to the underwater items to be protected.

Anode Cable Mount to take the Weight

Traditional hanging anodes have the wire cast into the anode material and once consumed the whole system has to be disposed of. The hanging anode range from MG DUFF features an interchangeable anode system allowing the replacement of the anode material without disturbing the bonding system. This is particularly useful when a craft is moored in differing water types as the system allows the correct anode material to be selected whilst only using one hanging cable. It can also be used to back up existing anode systems. Another advantage is the anode can be checked by simply lifting the anode out of the water and visually inspecting it for wear.

Hanging anodes are only to be used when the vessel is moored. When under way, coil the cable and secure with the supplied re-usable rubber tie wraps. Store the anode and cable away until required. Never start an engine with a hanging anode deployed, the anode may be drawn into the propeller and cause damage.

\* All anode weights shown are nominal \*  
Images are representative.

### Hanging Anode Kit

The complete system comprises of galvanised cable with a bright red pvc outer. Two re-useable rubber tie wrap are included to help store the anode when not in use. The included cable mount is designed to be secured to the vessel and **must** take the weight of the anode. The electrical connection is made via a robust m10 terminal.

## PROPELLER ANODES

### Radice Propeller Anode

Propeller nut anodes replace the existing locknut used to hold the propeller to the prop shaft, with a boss that allows an anode to be secured to it. It also features a locking tab washer to ensure the nut stays tight.

Prop nut anodes, similar to shaft anodes help provide protection to the prop and shaft, and do not rely on bonding wire as they attach directly to the item to be protected.

Where a hull mounted anode is **not** fitted it is advisable to fit a shaft anode (see pages 20 & 21) **as well** as a prop nut anode.

## PROPELLER ANODES

### Gori Propeller Anodes

MGDUFF supply five replacement anodes to suit the most popular of the GORI folding propeller range. Currently supplied in Zinc for Salt Water – here's the GORI pattern types:

SALT WATER	BRACKISH WATER	FRESH WATER
<b>CMG0536Z</b> Zinc Anode	<b>N/A</b> Aluminium Anode	<b>N/A</b> Magnesium Anode
0.04 KG		

Overall Dimensions (mm)			Anode Suitable For Propeller Type
Length	Width	Depth	8mm Dia Hole for 15 - 16.5" 3 Blade Prop (Mounting screw not included) OEM 14072100
N/A	26	16

## SAILDRIVE ANODES

### Saildrive Anodes

Saildrives have anodes specifically designed to fit on the gearbox housing, with some types able to be replaced without removing the propeller. Whatever style is used, we recommend the fastening screws are assembled and tightened with a small amount of liquid threadlocker to prevent loosening, then tested for electrical continuity after fitting.

Changing the propeller material (i.e. from aluminium to bronze) may require additional anodes – see 'type D' vessels in our technical pages. If fitting a folding propeller, check if it has an integral shock absorbing sleeve, as this can isolate the propeller from the Saildrive anode. In this instance the propeller normally has extra anodes fitted to the hub.

Zinga is a film-galvanising system comprising precisely milled zinc particles suspended in a unique liquid base. It bonds to any prepared steel substrate to form a finished surface layer of 96% zinc.

Zinga has all of the advantages of hot-dip galvanising and thermal zinc spray, but none of their application and overcoating problems. Steel coated in up to 60 µm of Zinga can still be welded.

#### Zinga is:

- ✓ Easy to use.
- ✓ A cost-effective alternative to hot-dip galvanising.
- ✓ Highly resistant to mechanical abrasion.
- ✓ Tested to ISO 12944 for corrosion protection
- ✓ Certified as non-flammable (BS 476 parts 6 & 7: fire propagation and surface spread of flame).
- ✓ Suitable for large and small areas, from bridges to nuts and bolts.
- ✓ NORSOK Standard M-501 Revision 5 approved.
- ✓ Holds part number with London Underground
- ✓ Be used on top of existing galvanising, existing or damaged zinc thermal spray or a previously applied layer of Zinga.
- ✓ More than double the service-life when part of a duplex system.

- ✓ Be applied to damp surfaces in up to 90% relative humidity.
- ✓ Be applied in extreme temperatures: from minus 15°C to plus 40°C.

#### Zinga offers:

- ✓ Longer protection than hot-dip galvanising applied to the same thickness (DFT).
- ✓ On-site application.
- ✓ Excellent adhesion properties.
- ✓ Extreme flexibility: it will not crack or delaminate.

#### Technical Specification:

Surface Preparation

Grit blast to SA2.5  
(Rz 50 - 70 µm)

Approx. Drying Times @ 15°C

Touch Dry

10mins

Dry to Handle

30mins

Overcoat with Zinga

30 - 60mins

Overcoat with Epoxy

24 hrs

Application Temp Range

-15°C to +40°C

Application Humidity Range

90%

Substrate Temp

>3°C above DewPoint

Thinner

Zingasolv

Cleaner

Zingasolv/Gunwash

Pot Life

Unlimited

Packaging

1Kg Can

2Kg Can

5Kg Can

10Kg Can

25Kg Can

500ml Spray

#### Theoretical Coverage:

When brushed, rolled or spray applied the layer thickness should be approximately 50 µm DFT. At this film thickness Zinga will provide a coverage of 3m/Kg.
